

A comparative study of different DAS vendors data

Jorge Monsegny, Daniel Trad, Don Lawton

Calgary, Canada
December 3 2020

Time-lapse seismic images of the Sleipner CO₂ plume. From Chadwick, 2010

Things that change with time in time-lapse seismic

Reservoir properties:

1. Pore pressure
2. Pore fluids
3. Temperature
4. Compaction
5. Porosity
6. Density
7. Overburden stress
8. Fractures
9. Chemical changes

Seismic observables:

1. Times
2. Amplitudes
3. Velocities
4. Frequencies and phases

Undesirables:

1. Ambient noise
2. Environment changes
3. Near surface velocities and effects
4. **Recording equipment characteristics**
5. **Acquisition parameters**
6. Processing parameters
7. Processing software

- Each recording instrument have its own different impulse response.
- The different equipment responses should be considered with a view to apply filters to equalize them.

From Jack, 1997

- **Positioning systems**
- **Source arrays**
- **Source depths**
- **Vibroseis parameters**
- **Charge size**
- **Receiver arrays**
- **Number of detectors**
- **Receiver channel spacing**
- **Shot spacing**

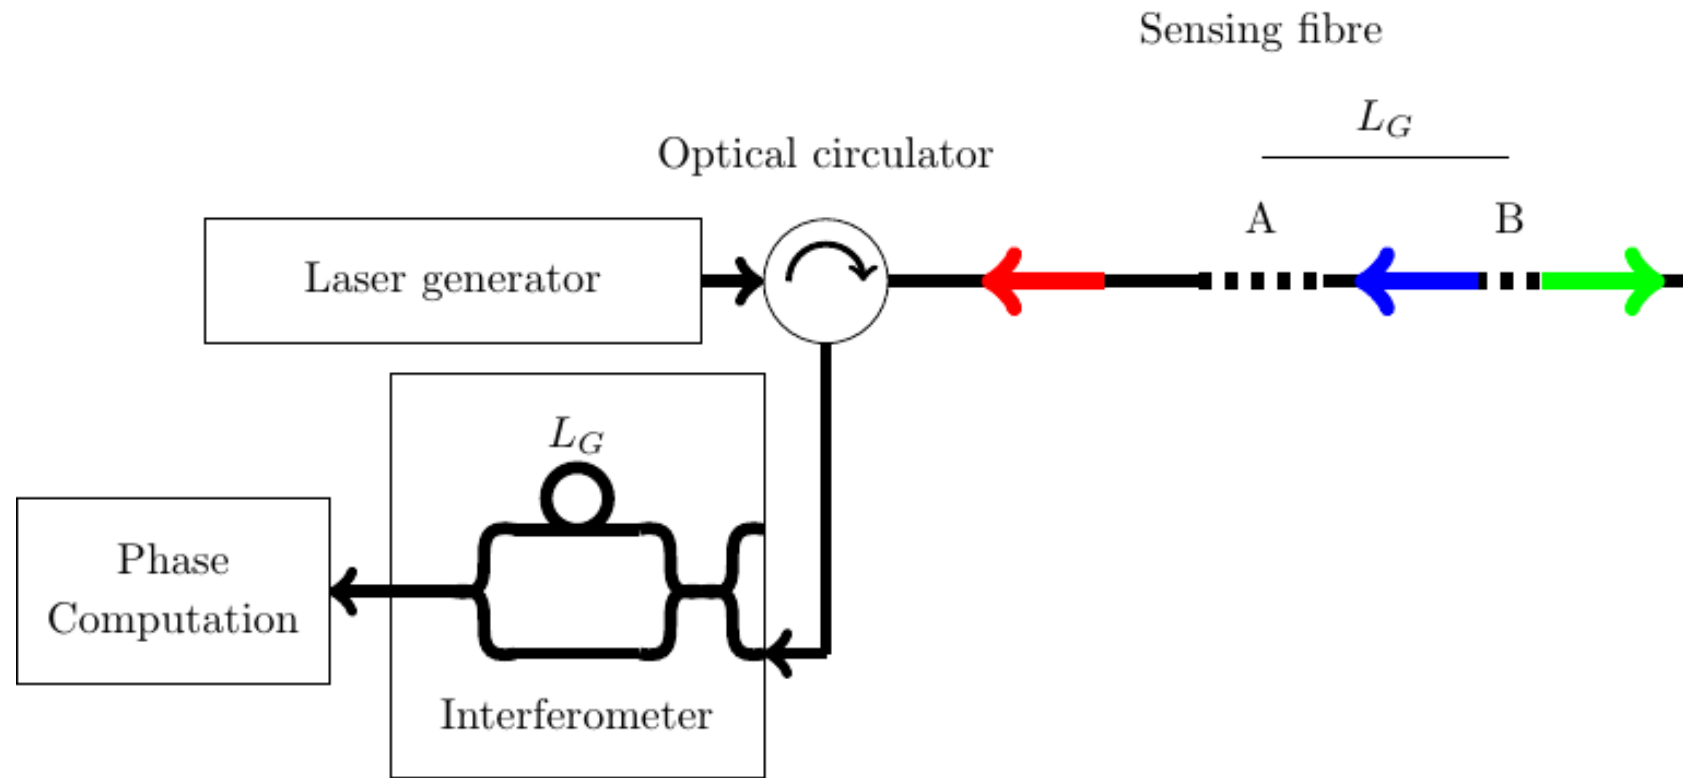

Motivation

= or ≠ ?

DAS principles

(Modified from Posey et Al., 2000)

Interference pattern dynamic phase:

$$\Phi_A - \Phi_B + \frac{4\pi n \xi \delta l}{\lambda}$$

Strain from measured fibre length change:

$$\epsilon_f(s) = \frac{\delta l}{L_G}$$

- Correction to strain-optical effect:
 $\xi = 1 - \frac{n^2}{2}(P_{12} - \nu(P_{11} + P_{12}))$
- Refraction index:
 $n : 1.456$
- Strain-optic tensor:
 $P_{11} : 0.121$
 $P_{12} : 0.270$
- Optical fibre Poisson's ratio:
 $\nu : 0.17$

Containment and Monitoring Field Research Station CaMI-FRS

Containment and Monitoring Field Research Station CaMI-FRS

- The three vendors DAS data showed a checkerboard low frequency noise, maybe related to the surface operations.
- Data from one vendor was the opposite polarity than the others.
- After applying a basic data conditioning, the three vendors DAS data showed similarities in the early times, but differences in phase at later times.
- The phases differences vary slowly from trace to trace, this could be a registration issue related to the traces separation.

1. Describe the datasets
2. Show the raw shot gathers
3. Perform some data conditioning.
4. Show the conditioned gathers
5. Compare some individual traces.

Selected DAS VSP shot gathers

Vendor	Line	Acquisition time	Shot Point
Geophone	23	October 2017	130
Vendor 1	23	October 2017	130
Vendor 2	23	October 2017	130
Geophone	21	October 2017	131
Vendor 1	21	October 2017	131
Vendor 3	21	February 2018	131

The source was always an Envirovibe with a 20s linear sweep from 10 to 150Hz

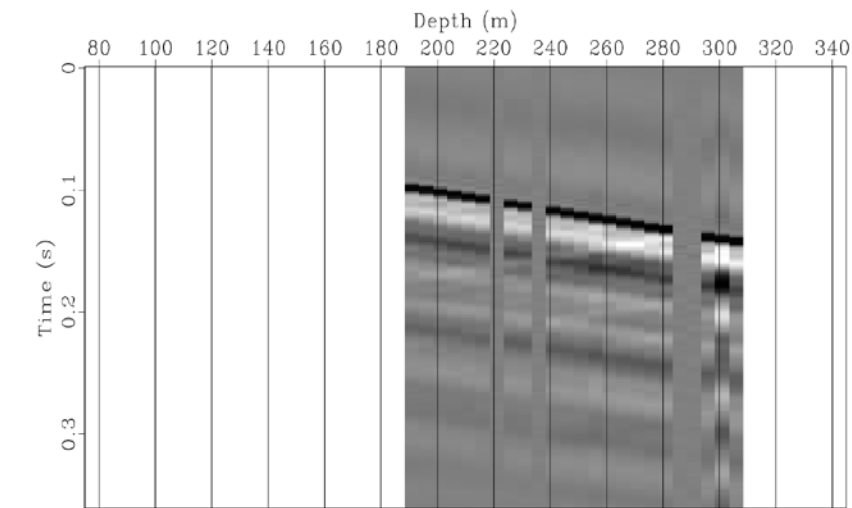

Geophone L23 S130 raw

Vendor 1 L23 S130 raw

Vendor 2 L23 S130 raw

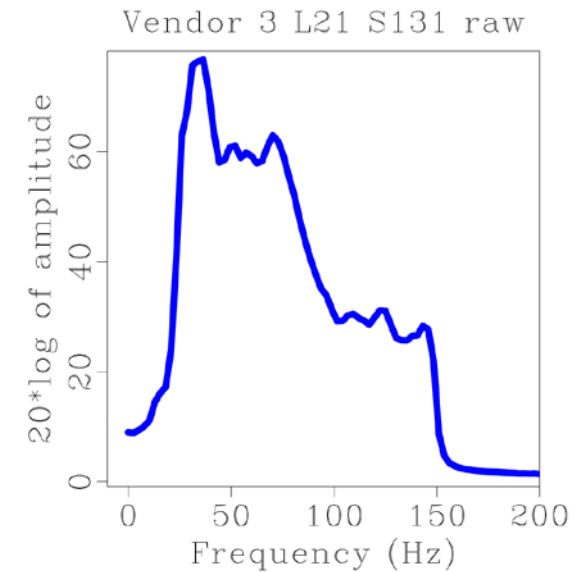

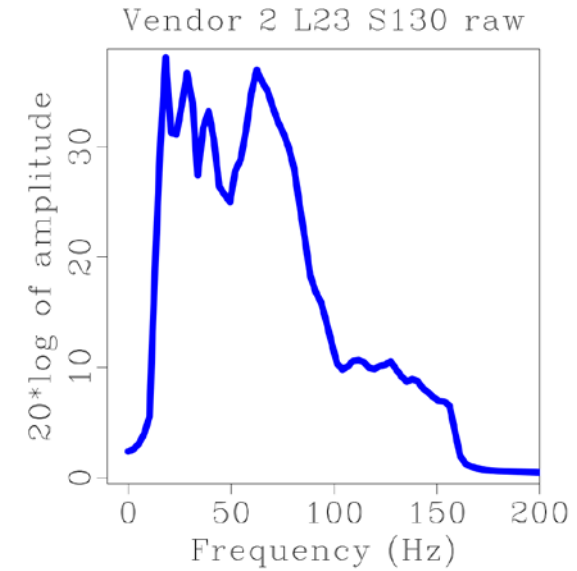

Geophone L21 S131 raw

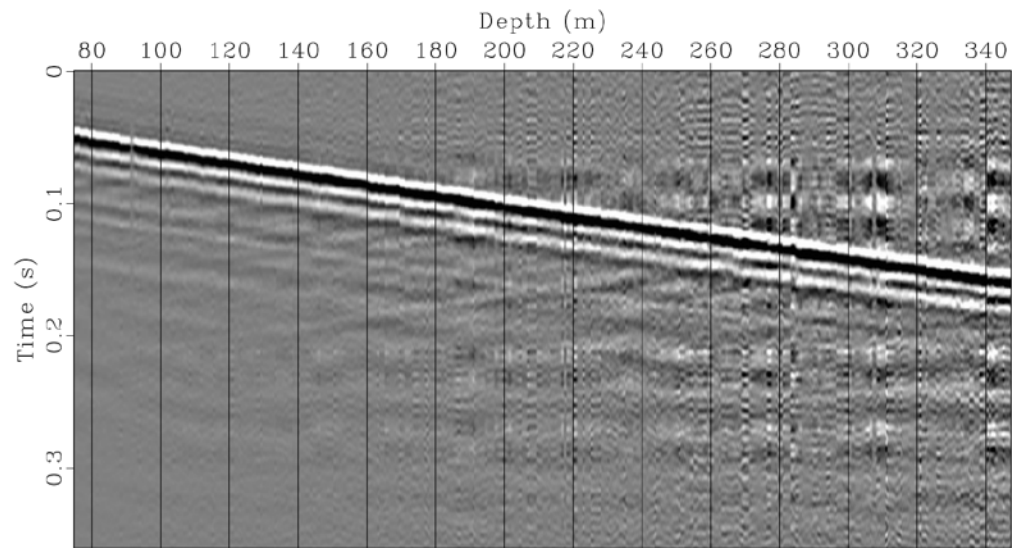

Vendor 1 L21 S131 raw

Vendor 3 L21 S131 raw

Checkerboard noise suppression

Vendor 1 L23 S130 bp 20Hz

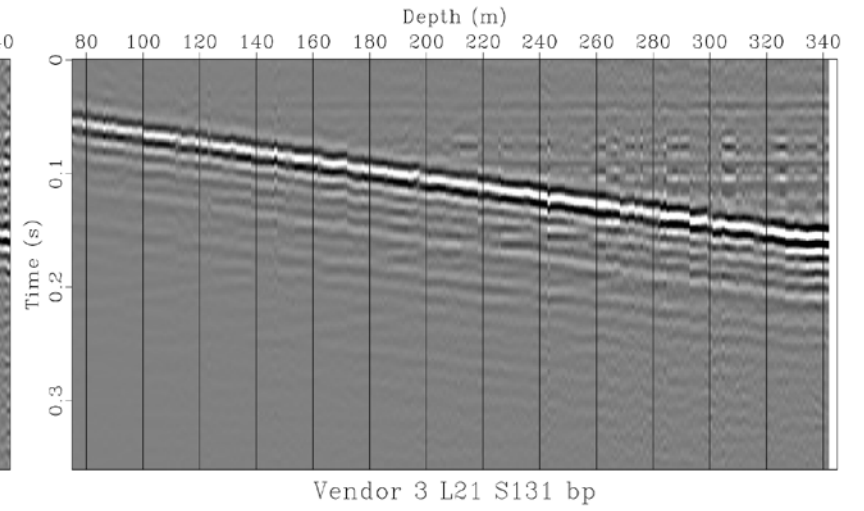

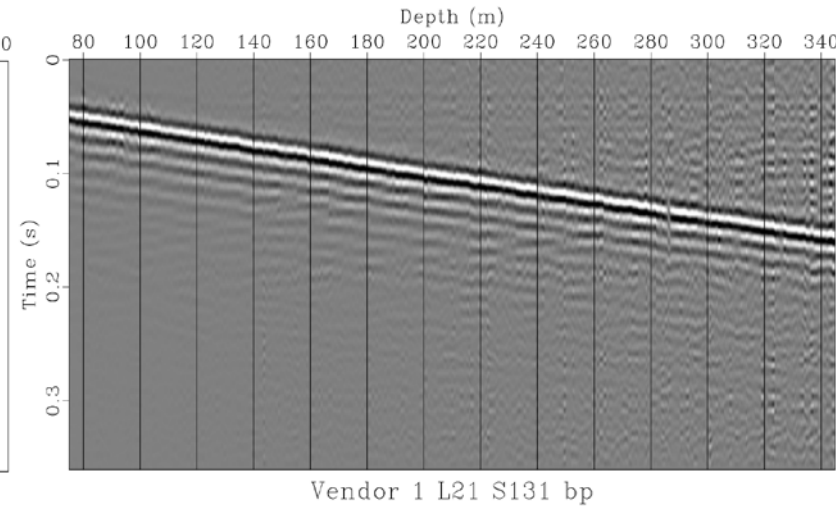

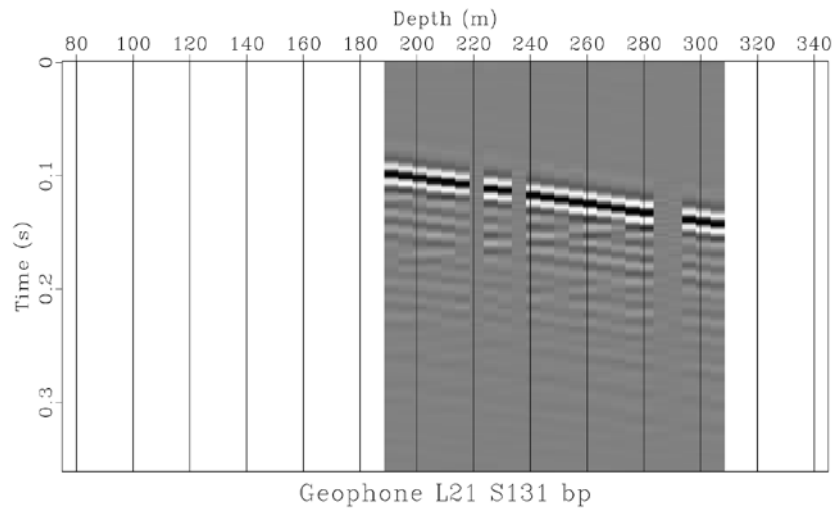

Vendor 1 L23 S130 bp 35Hz

Vendor 1 L23 S130 bp 50Hz

Filtered DAS VSP shot gathers

Filtered DAS VSP frequency spectra

- The three vendors DAS data showed a checkerboard low frequency noise, maybe related to the surface operations.
- Data from one vendor was the opposite polarity than the others.
- After applying a basic data conditioning, the three vendors DAS data showed similarities in the early times, but differences in phase at later times.
- The phases differences vary slowly from trace to trace, this could be a registration issue related to the traces separation.
