

How low can you go?  
Finding low frequencies in various  
places - Hussar example

Heather Lloyd & Gary Margrave

# Outline

- Why do we need low-frequencies and where did they go?
- How do we get low-frequencies back?
  - Borrow them
  - Predict them
  - Record them
- Low-frequency conclusions

# Full Spectrum & Band-Limited Reflectivity

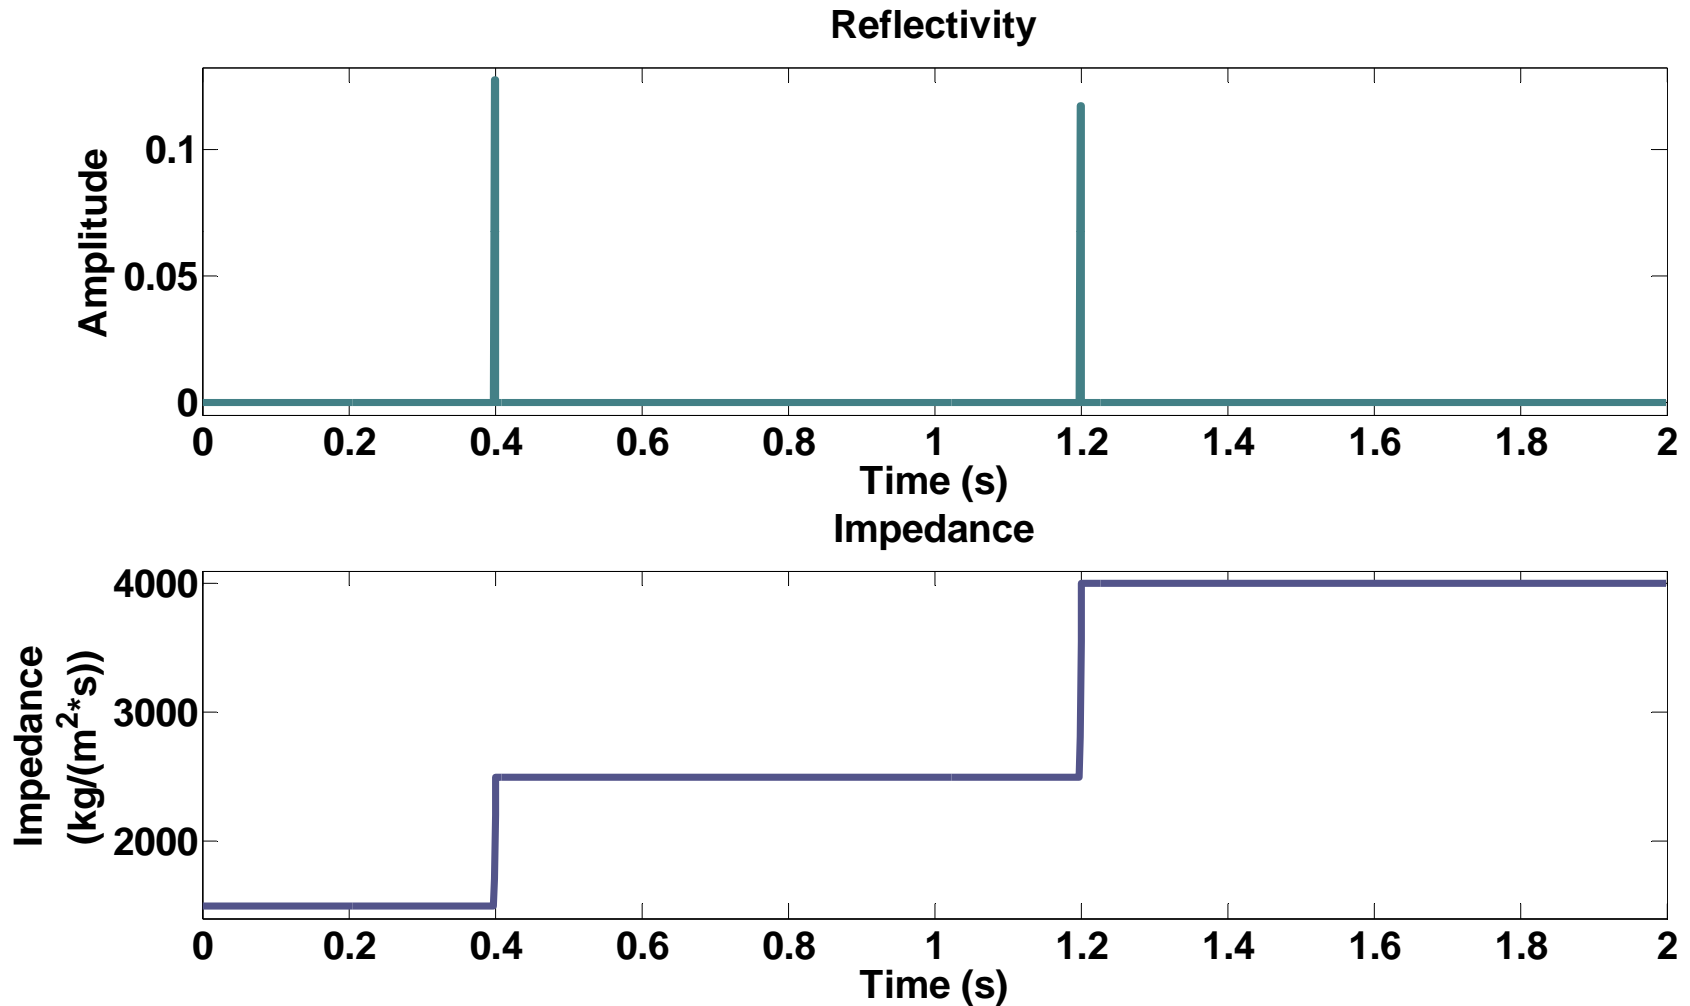

# Recursion Formula

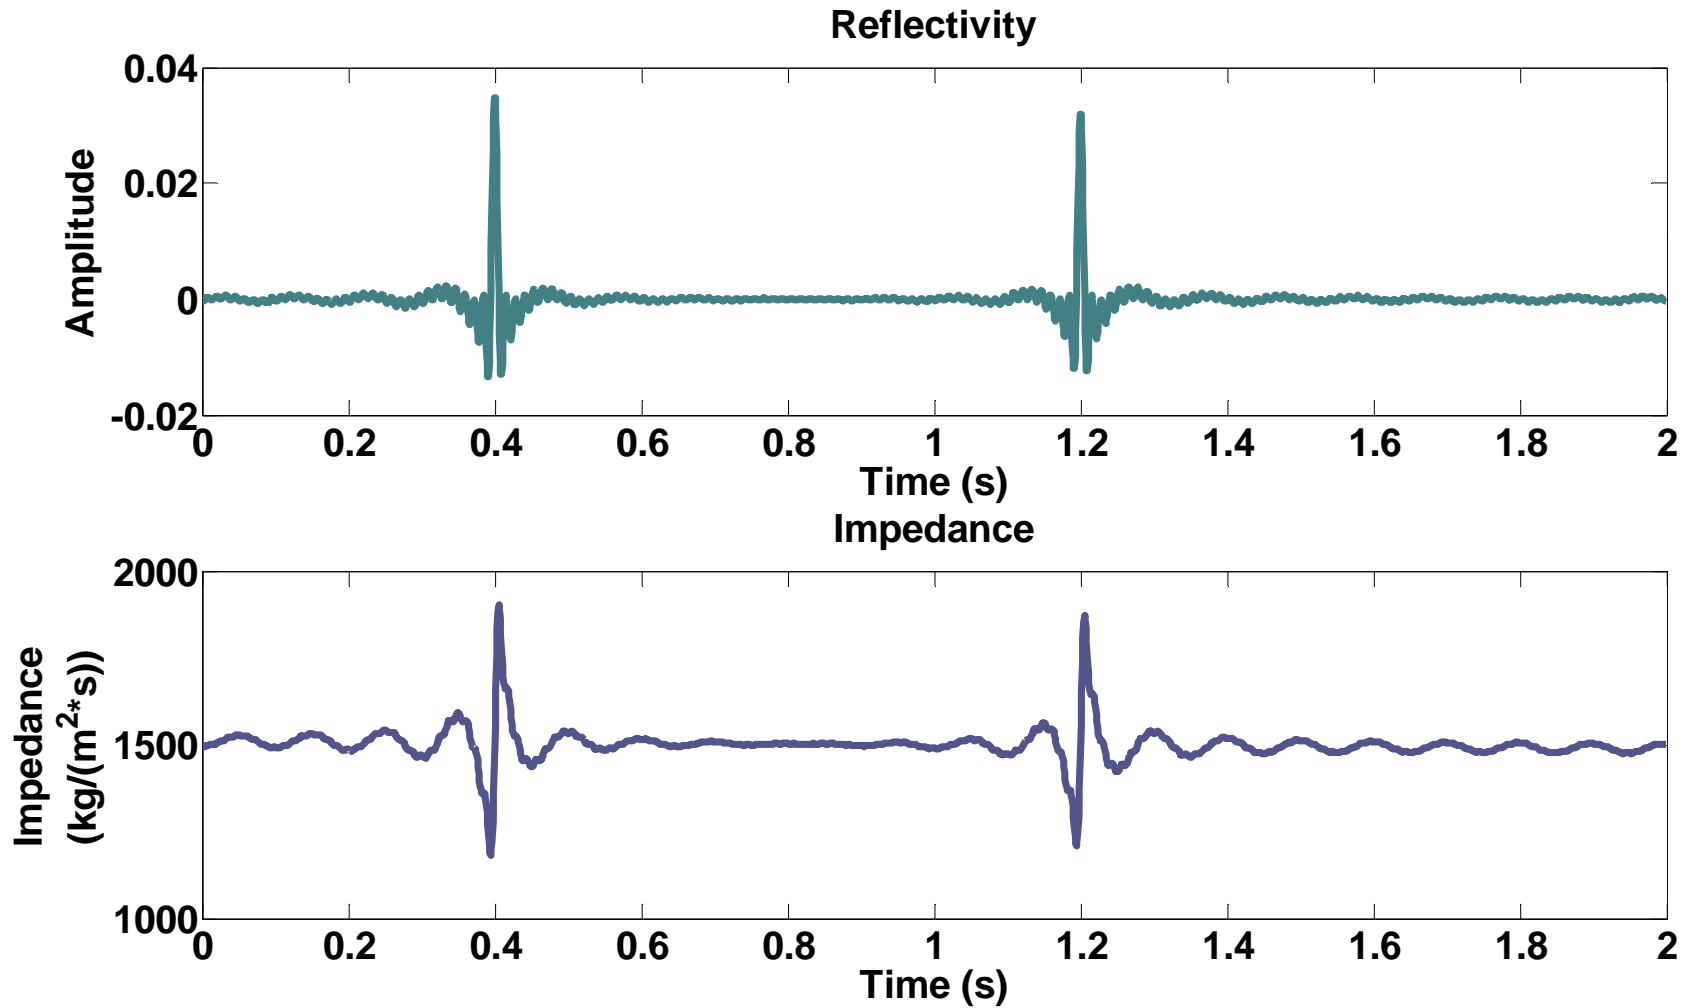

$$I_j = I_0 e^{\sum_{k=0}^j r_k}$$

(Oldenburg et al., 1983).

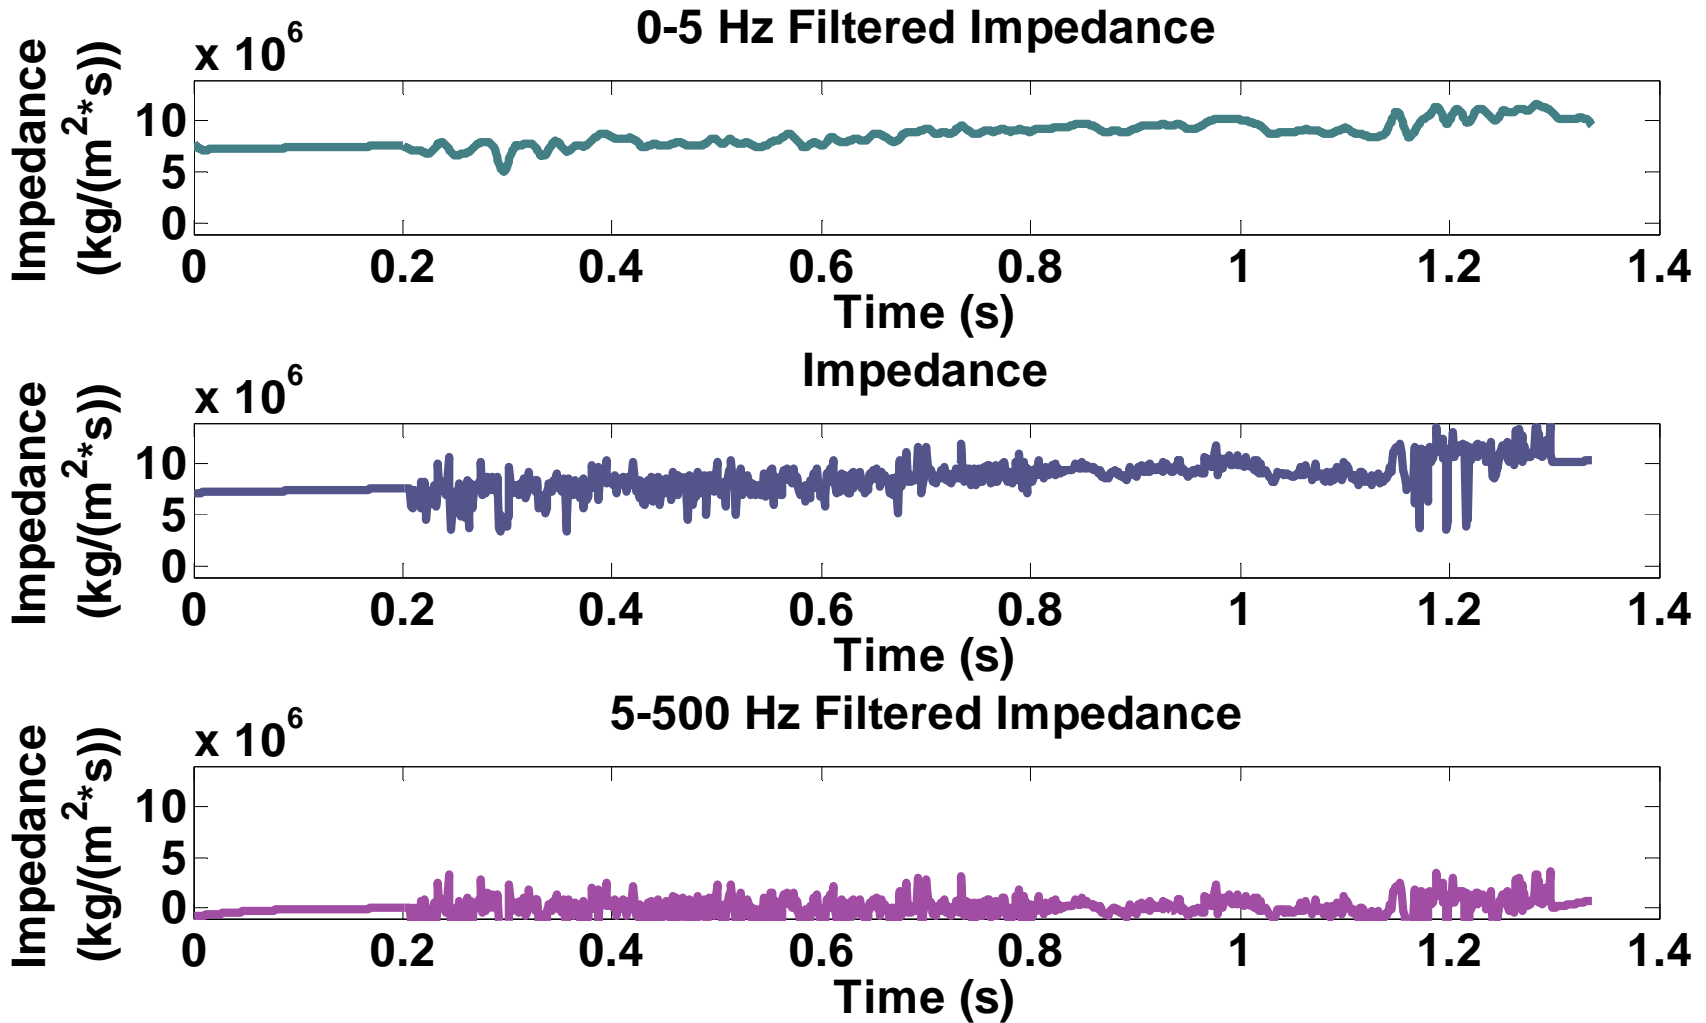

# Full Spectrum Inversion/model

# Band-Limited Inversion

# Real Well Log Example

(From Lindseth 1979).

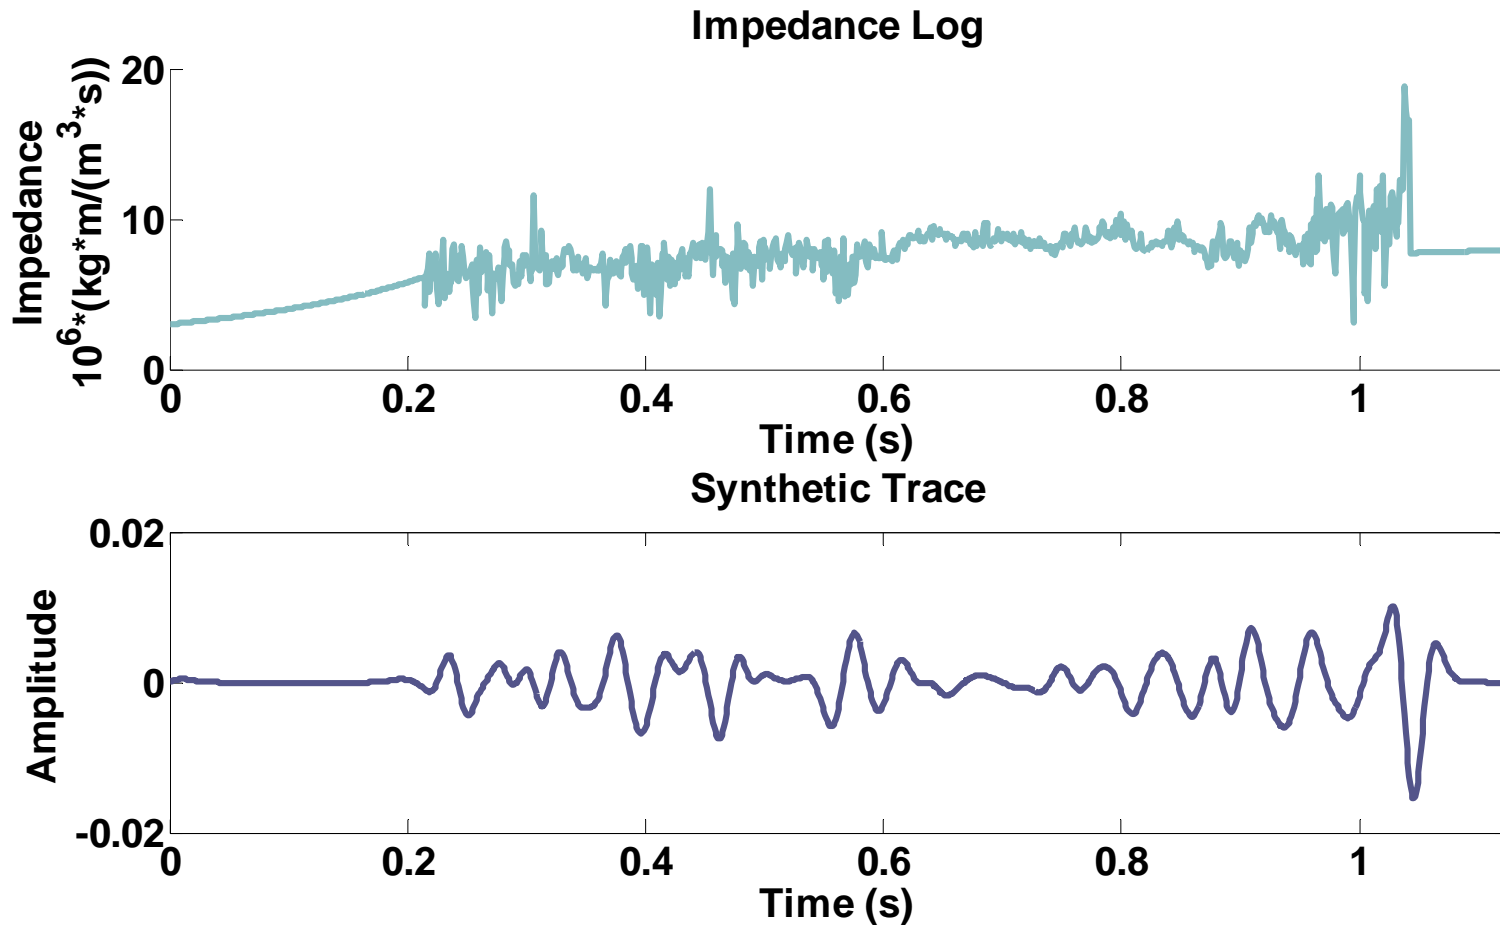

# How do we get low-frequencies back?

- Model them
- Borrow them
- Predict them
- Record them

# Borrow Them

# Borrow low-frequencies using BLIMP

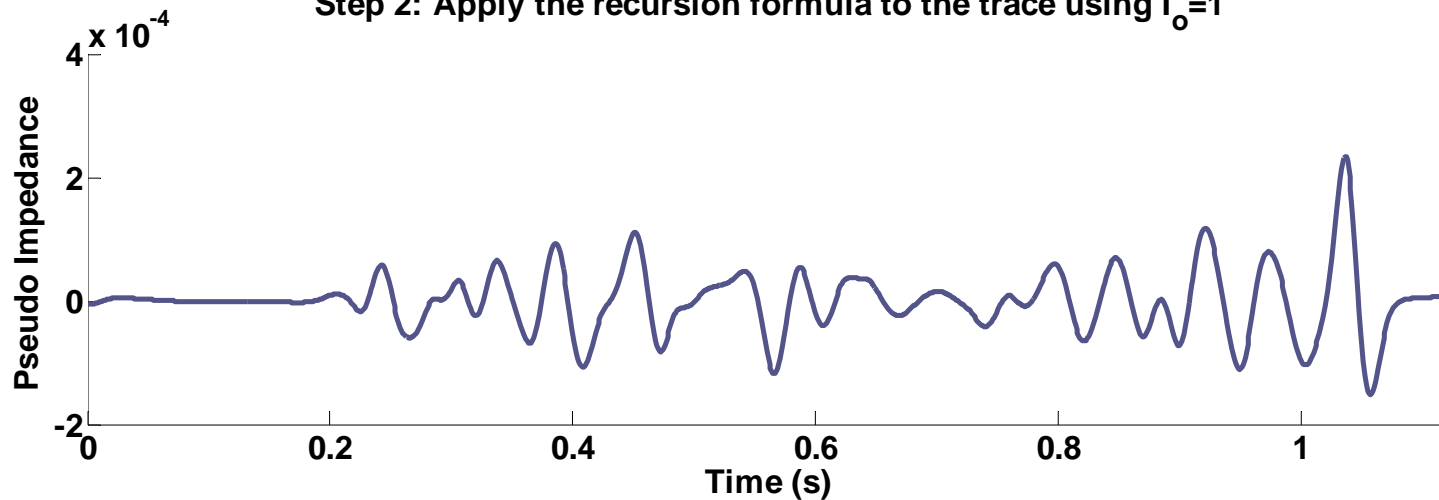

# BLIMP Steps 1 & 2

Step 1: Remove the linear trend from the impedance log

Step 2: Apply the recursion formula to the trace using  $I_0=1$

# BLIMP Steps 3 & 4

**Step 3: Compute the Fourier transform of the impedances**

**Step 4: Determine a scalar using the mean power of the impedance log spectra and apply it**

# BLIMP Steps 5 & 6

# BLIMP Step 7

Step 7: Inverse Fourier transform the solution and add the linear trend

# BLIMP Inversion Problems

- Sensitive to low-frequency cut-off
- Best applied to one trace or a model without structure
- Relies heavily on log information

# Predict Them

# Prediction Filters

## One-Lag Prediction Filter

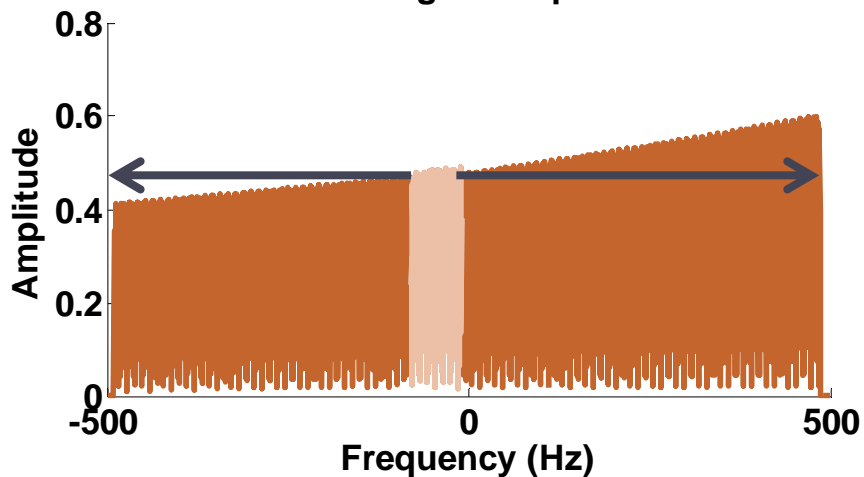

$$\begin{bmatrix} d_0 & 0 & \cdots & 0 \\ d_1 & d_0 & \cdots & 0 \\ \vdots & \vdots & \ddots & 0 \\ d_m & d_{m-1} & \cdots & d_0 \end{bmatrix} \times \begin{bmatrix} a_0 \\ a_1 \\ \vdots \\ a_n \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ \vdots \\ d_{m+1} \end{bmatrix}$$

## Multi-Lag Prediction Filter

$$\begin{bmatrix} d_0 & 0 & \cdots & 0 \\ d_1 & d_0 & \cdots & 0 \\ \vdots & \vdots & \ddots & 0 \\ d_m & d_{m-1} & \cdots & d_0 \end{bmatrix} \times \begin{bmatrix} a_0 \\ a_1 \\ \vdots \\ a_n \end{bmatrix} = \begin{bmatrix} d_{lag+1} \\ d_{lag+2} \\ \vdots \\ d_{lag+m} \end{bmatrix}$$

# Conclusions

- BLIMP inversion relies heavily on the low frequencies of the well impedance and is very sensitive to the low frequency cut-off value.
- Prediction filter low frequency recovery methods are good for simple models with flat wavelets currently this method is not suitable for wells or real data.
- Recording lower frequencies in the field is possible even down to 1Hz but some well information is still required.
