

# Improving deconvolution at low frequencies

Sina Esmaeili\*, Gary F. Margrave

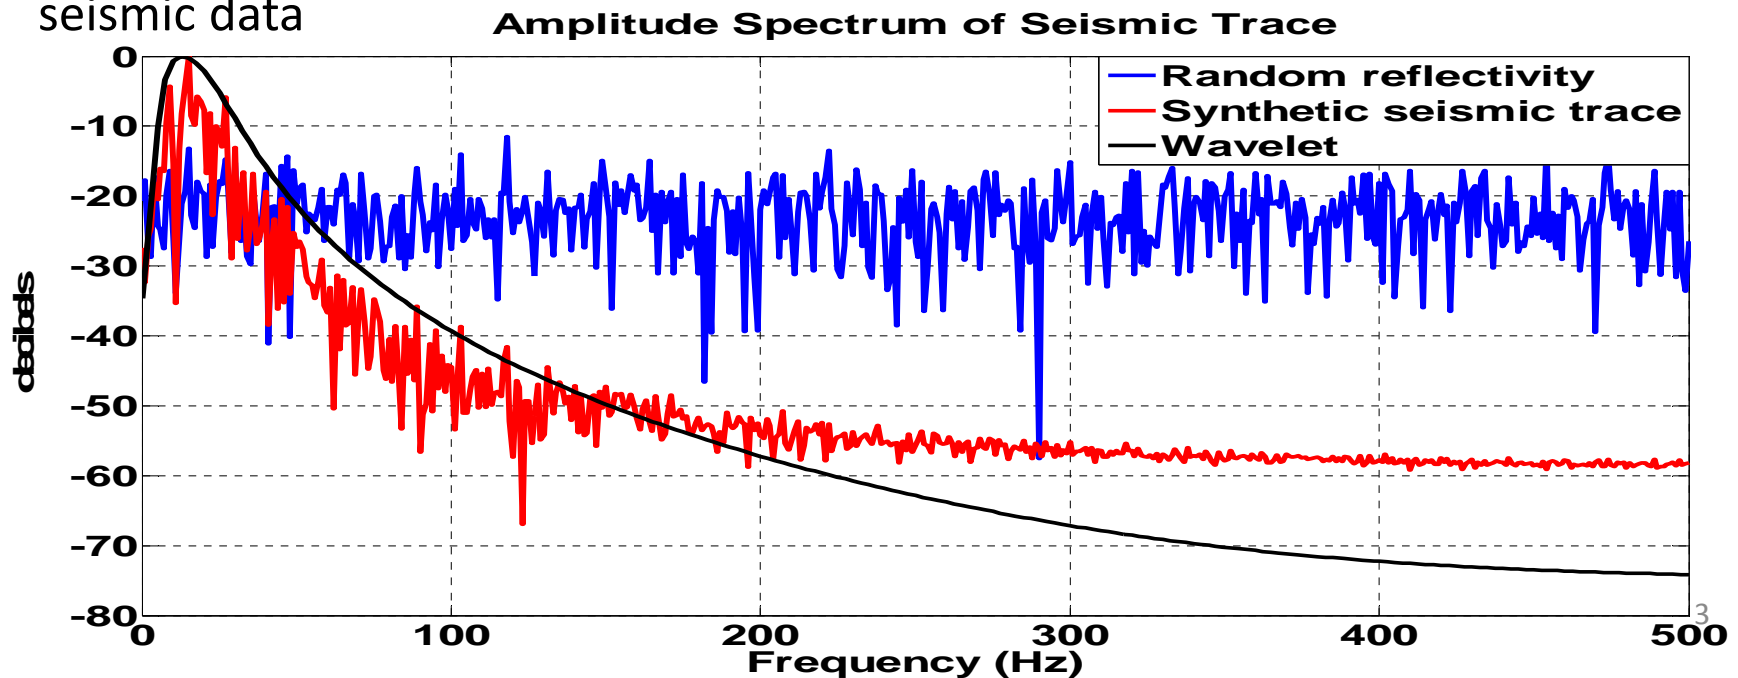

# Outline

- Introduction to Frequency domain deconvolution
- Various smoother types
- Minimum phase color operator
- Synthetic data processing and impedance inversion results
- Conclusion
- Acknowledgements

# Frequency domain deconvolution

- The easiest deconvolution technique to conceptualize
- Four assumptions:
  - The wavelet should be minimum phase
  - The wavelet amplitude spectrum should be smooth
  - The wavelet should be stationary
  - The reflectivity should be random so it has a white amplitude spectrum
- The embedded wavelet can be estimate by smoothing the amplitude spectrum of seismic data

# Smoothers for amplitude spectra

- Boxcar smoother (BS)

$$\bar{x}[i] = \frac{1}{2M+1} \sum_{j=-M}^M x[i+j]$$

Smoothed Random Data With 5 Point Boxcar Smoother

# Smoothers for amplitude spectra

- Gaussian smoother with constant  $\sigma$  (CGS)

$$\bar{A}_j = \frac{\sum_k A_k g_{j-k}}{\sum_k g_k} \quad g_k = e^{-(k\Delta f)^2 / \sigma_f^2}$$

# Frequency dependent smoother

- Gaussian smoother with frequency dependent  $\sigma$  (FDGS)
  - lower frequencies require longer temporal windows.
  - Higher frequencies require small temporal windows.

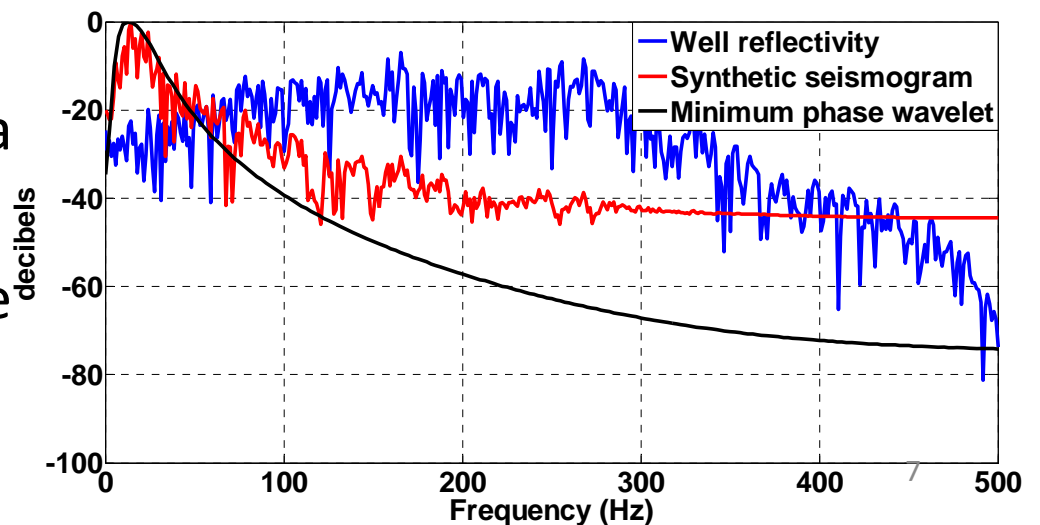

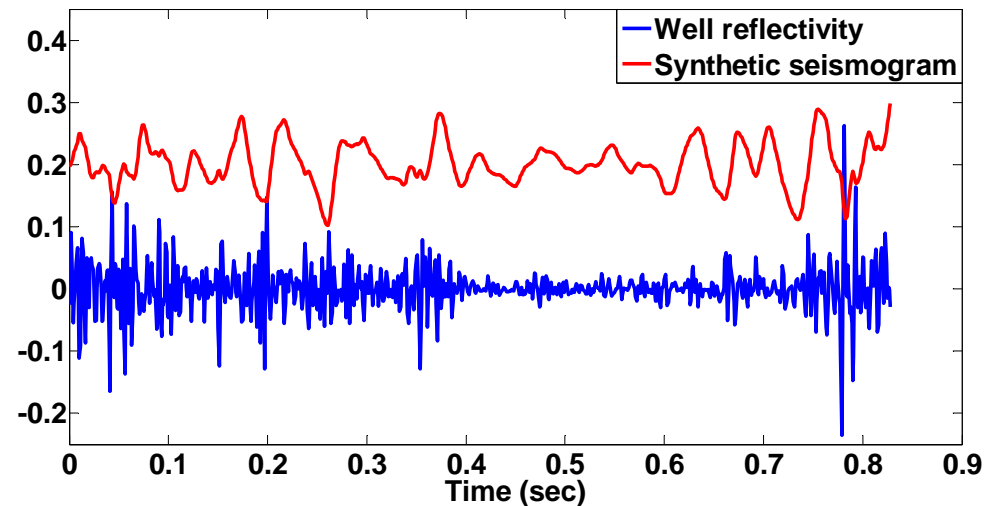

$$\sigma_f = \frac{f}{n} = \frac{k\Delta f}{n}$$

Frequency Dependent Gaussian Smoother For Different Frequencies

# Deconvolution of zero-offset synthetic data

- Synthetic seismogram created by *seismo* in CREWES Matlab toolbox
- Husky Hussar well 12-27 reflectivity
- 15Hz minimum phase wavelet with one millisecond sample rate.
- Only the P-wave seismic data are used
- The multiple reflections are not considered

# Deconvolution of zero-offset synthetic data

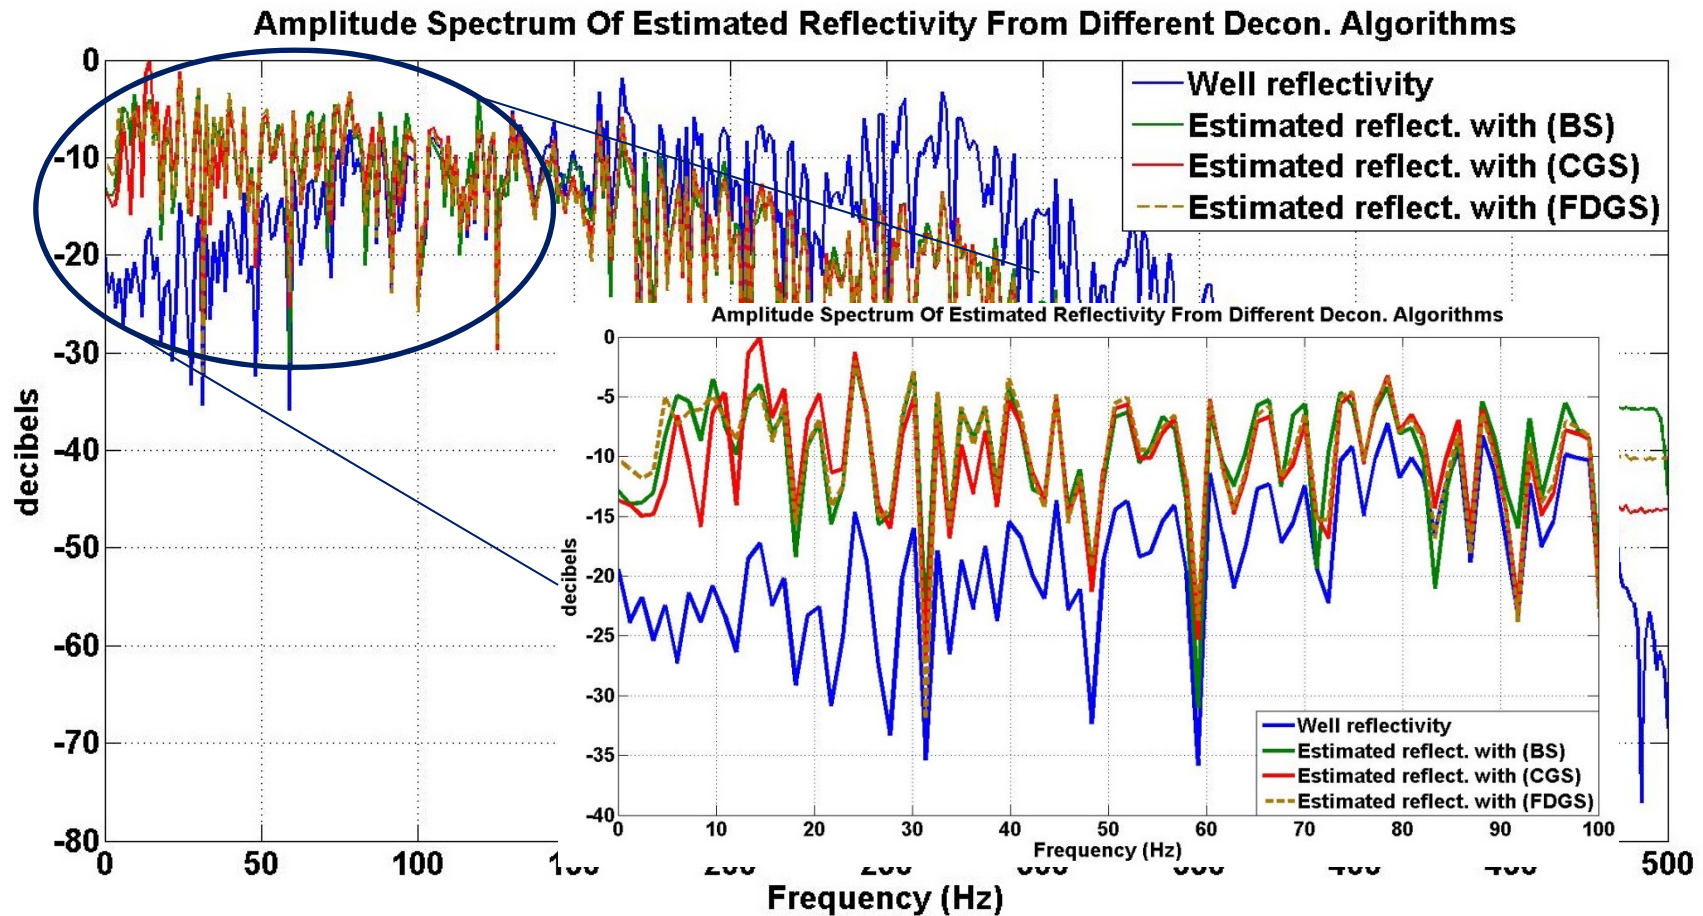

## Amplitude spectra

# Deconvolution of zero-offset synthetic data

## Smother choice makes little difference

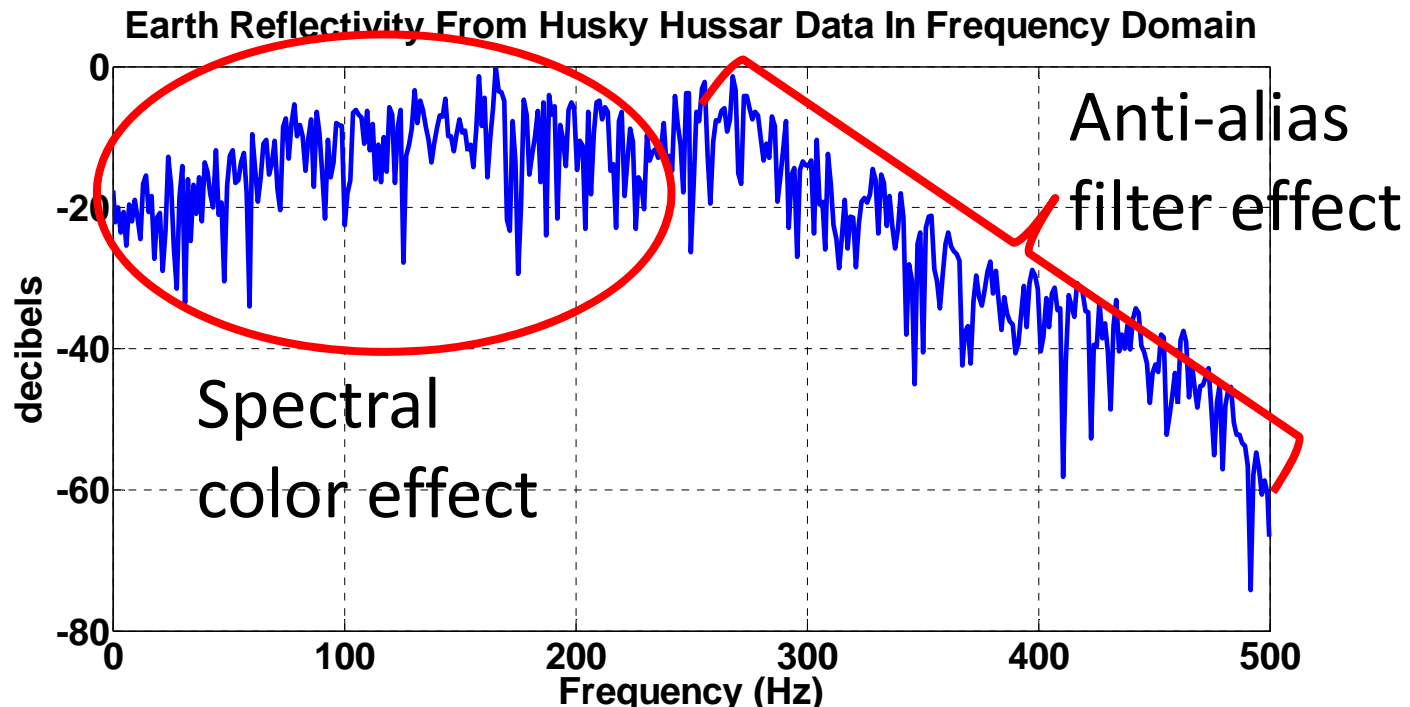

Deconvolution Type	Decon with BS	Decon. with CGS	Decon. with FDGS
Max Correlation	0.5866	0.6347	0.5939

# Where the problem is initiated!

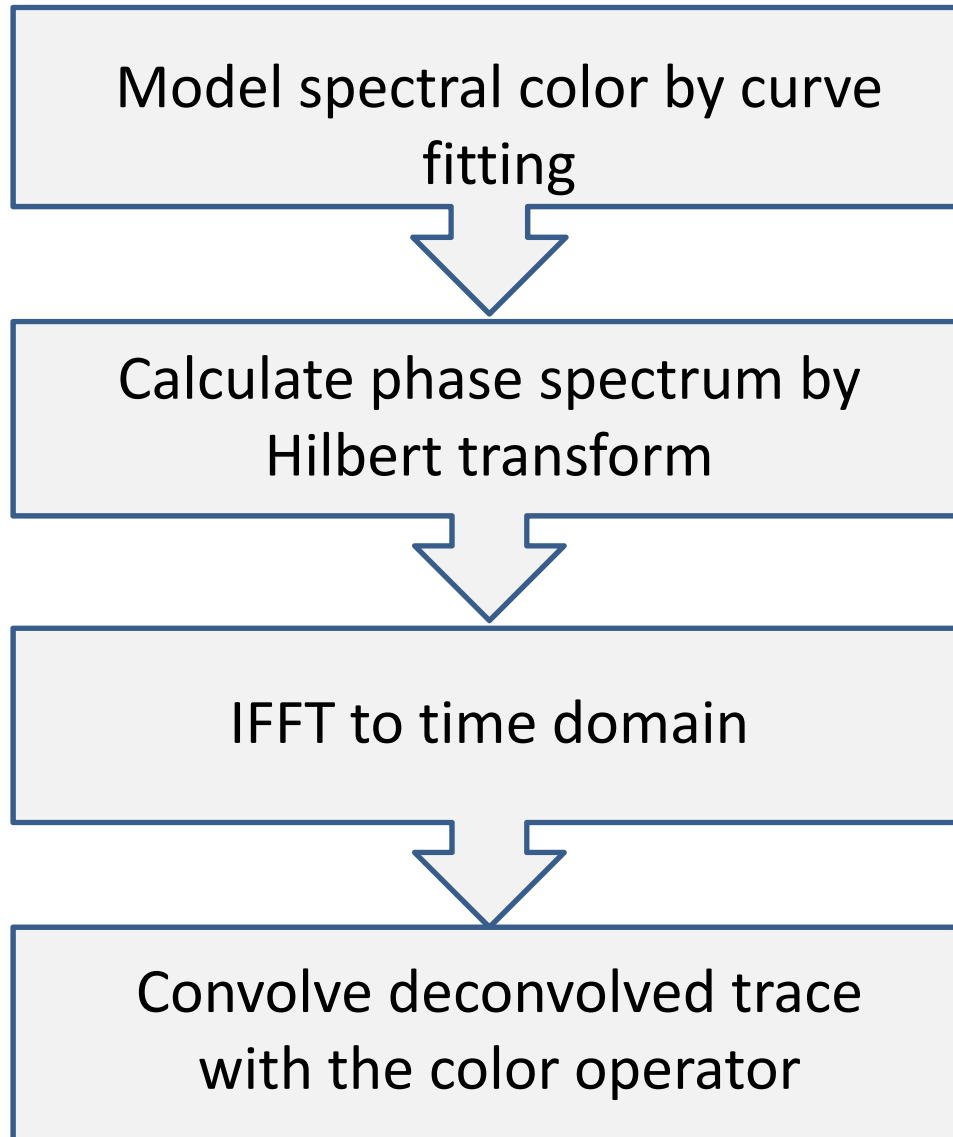

- ✓ The frequency domain deconvolution assumes that the amplitude spectrum of reflectivity should be white
- ✓ While the most reflectivities from wells all over the world do not have white spectra (Walden and Hosken, 1985).

# Minimum phase color operator

- ❖ The color operator should depend only on the observed spectral shape of the reflectivity.
- ❖ The color operator should be minimum phase.
- ❖ Only the frequencies below than 250 (in this case) are interested.
- ❖ Color spectrum should be flat at high frequencies but show low-frequency roll off.

# Minimum phase color operator

# Minimum phase color operator

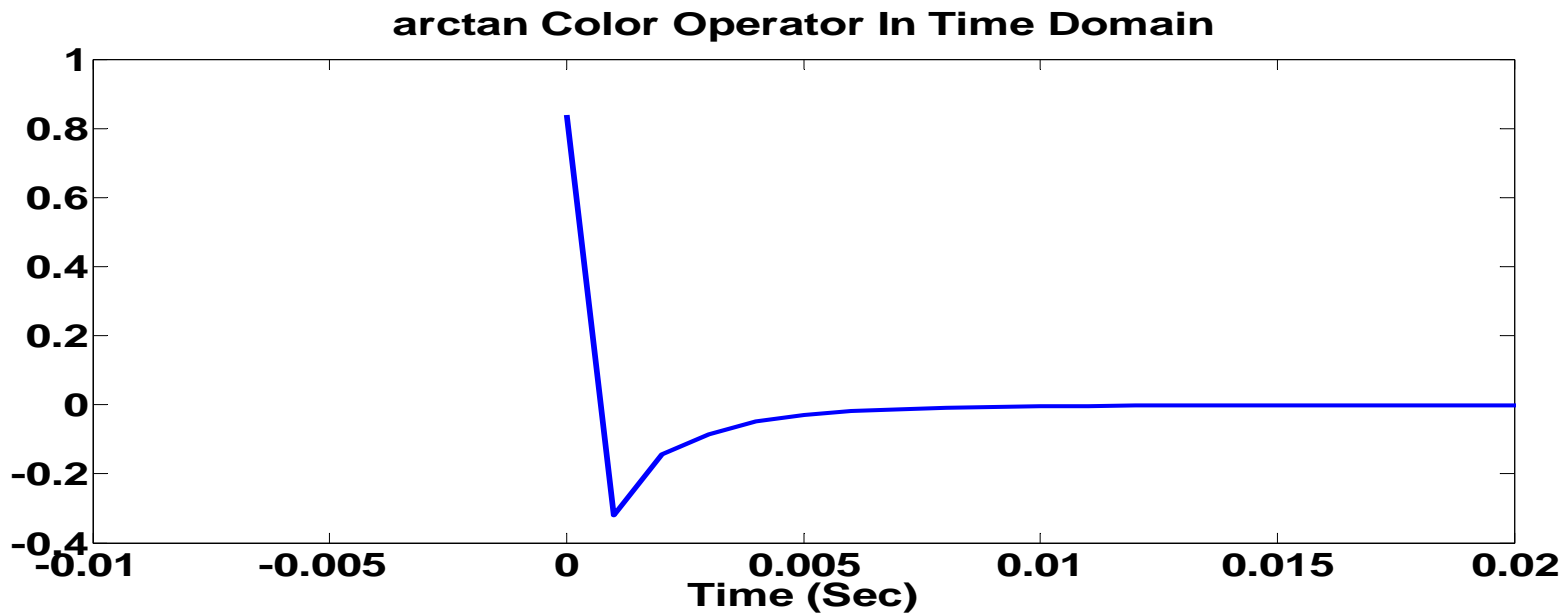

- arctan color operator

$$a + b \arctan(f) = R(f)$$

$$\begin{bmatrix} 1 & \arctan(f) \end{bmatrix}_{n \times 2} \begin{bmatrix} a \\ b \end{bmatrix}_{2 \times 1} = A \begin{bmatrix} a \\ b \end{bmatrix} = R_{n \times 1}$$

# arctan color operator

# Minimum phase color operator

- Sigmoidal color operator

$$\frac{a + bs}{\sqrt{1 + s^2}} = R(f) \quad \text{where: } s = \frac{f - f_0}{f_0}$$

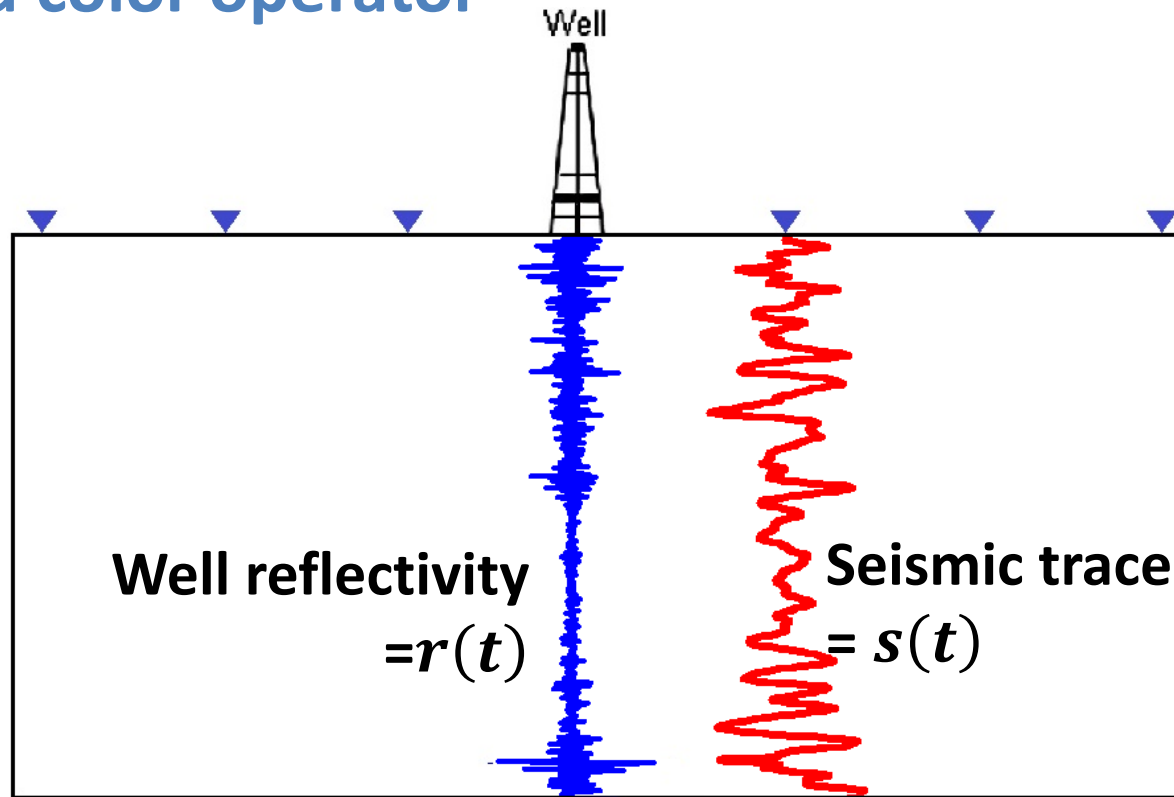

# Sigmoidal color operator

# Minimum phase color operator

- Forced color operator

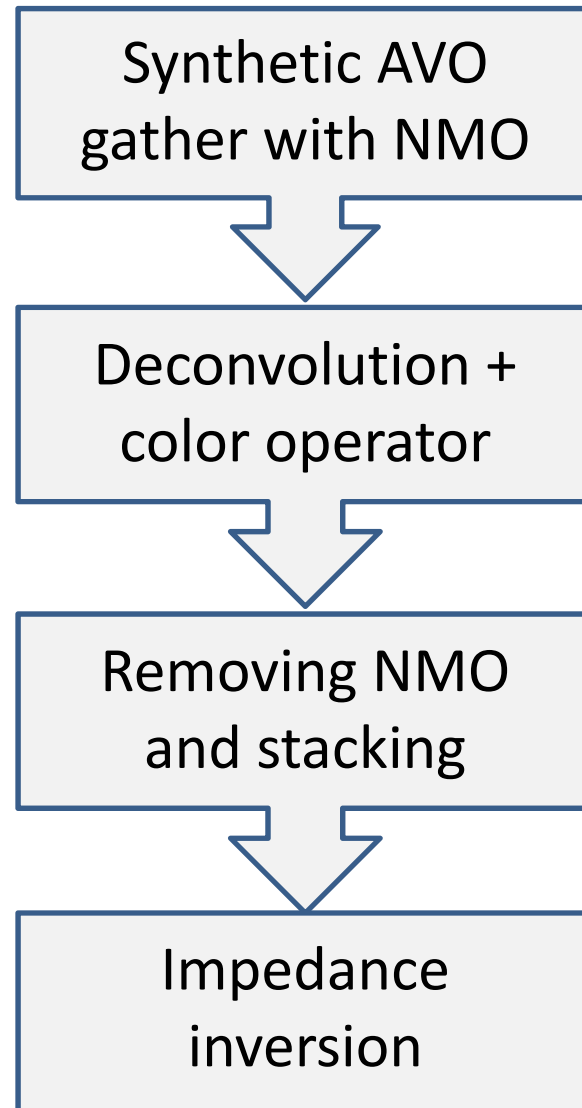

$$\text{Color model} = \left| \frac{R(f)}{S_d(f)} \right| * b(f)$$

$S_d(f)$  : Deconvolved Seismic trace

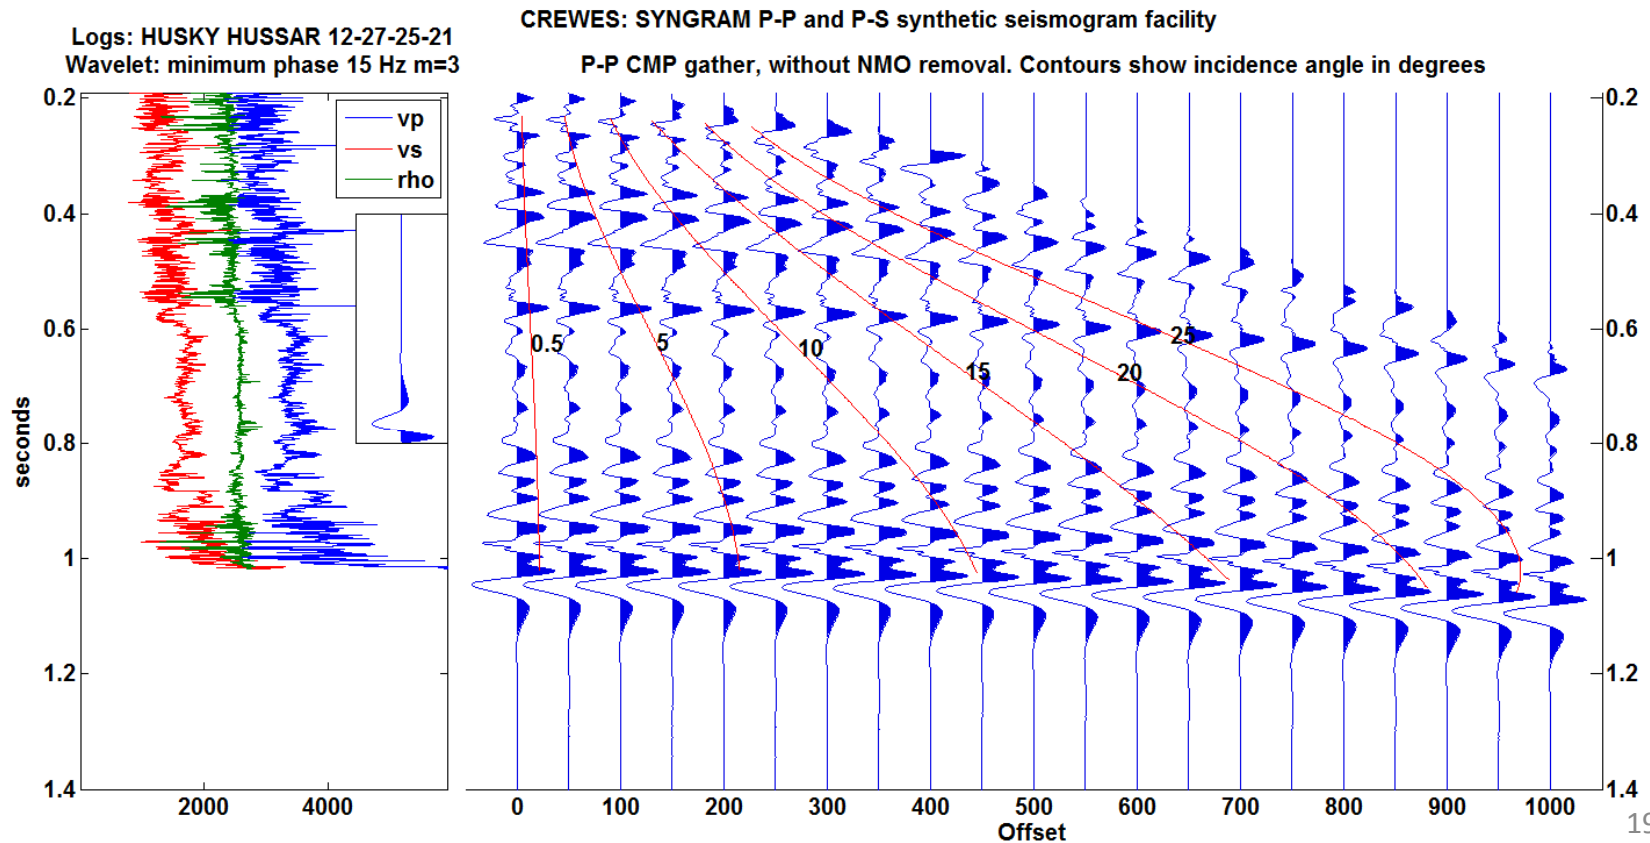

$b(f)$  : Smoother

# Processing synthetic AVO gather

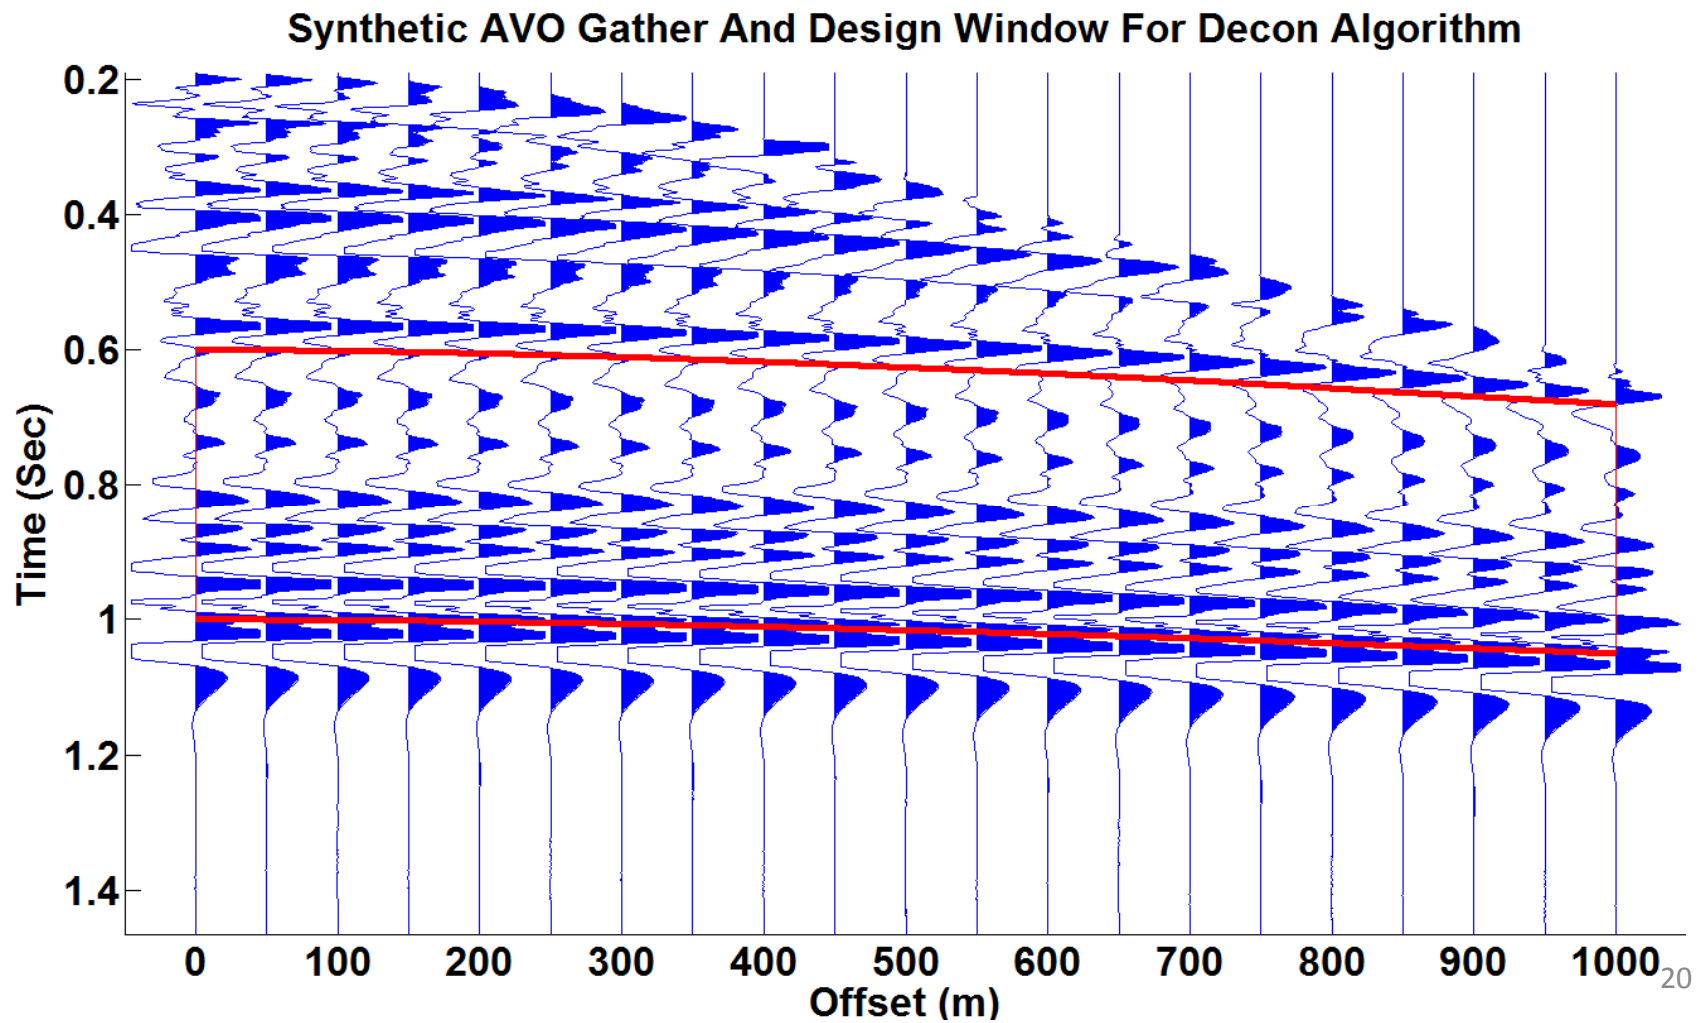

# Processing synthetic AVO gather

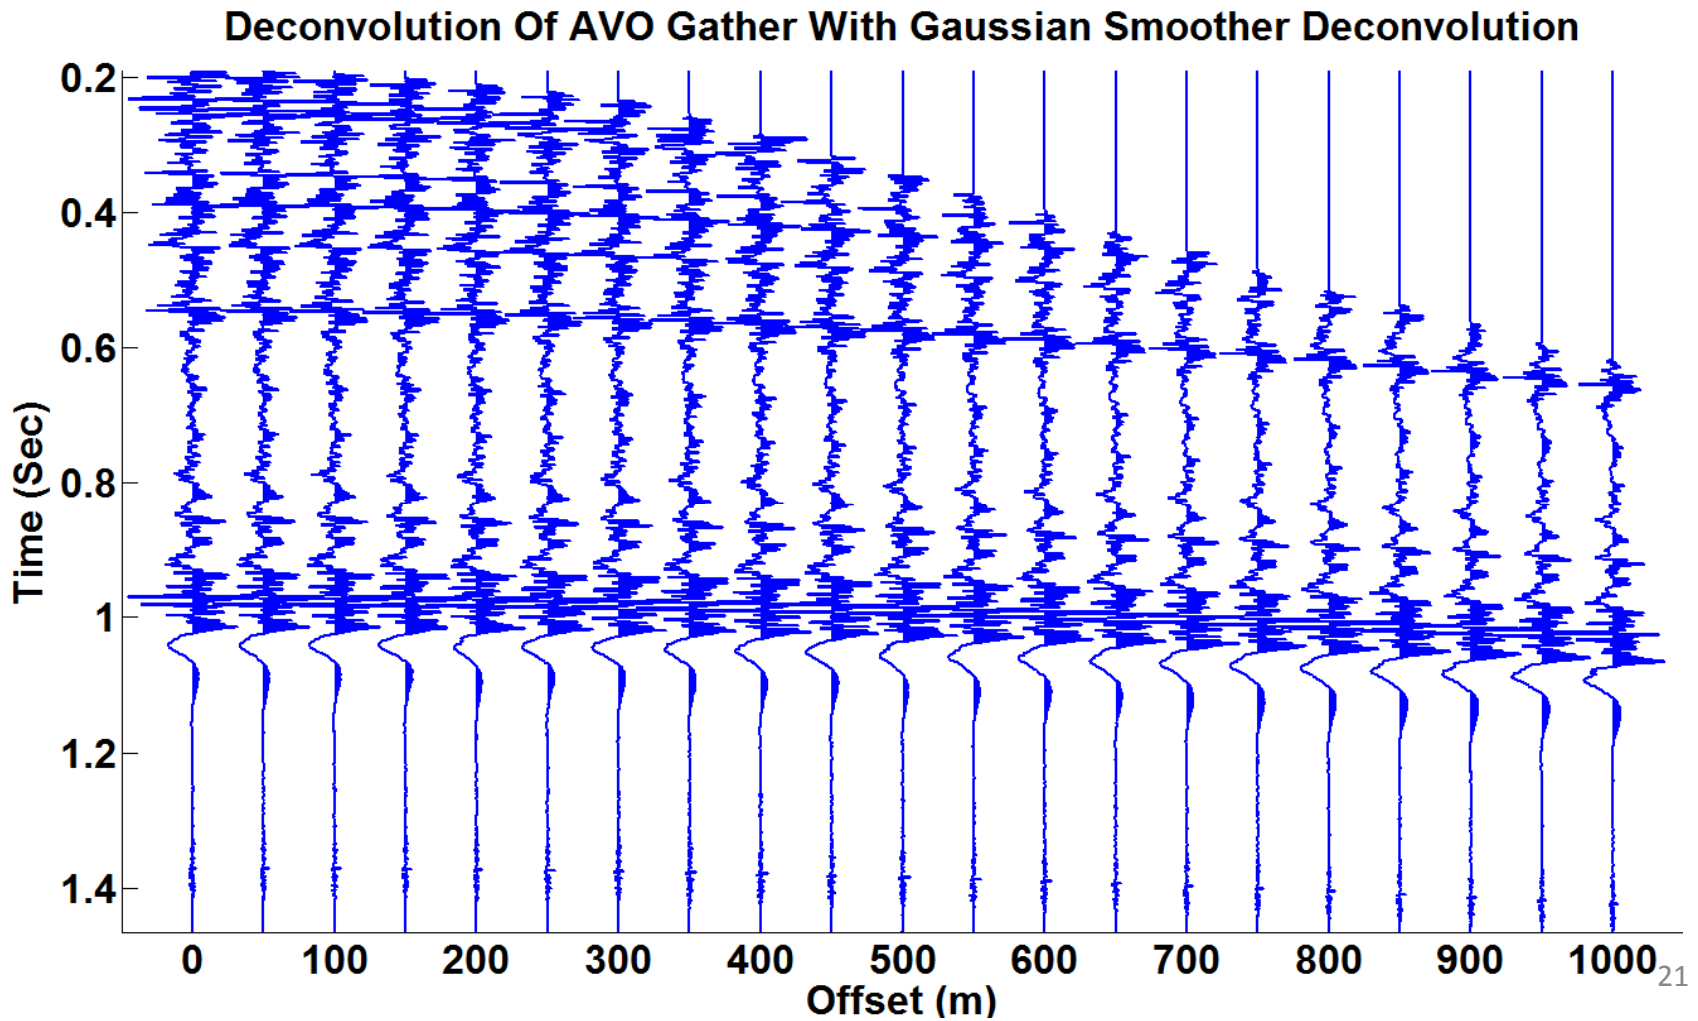

- Synthetic data created by *Syngram* in CREWES Matlab toolbox.
- Husky Hussar well 12-27 data have been used.
- 15Hz minimum phase wavelet with one millisecond sample rate.

# Designing window for decon algorithm

# Deconvolution synthetic AVO gather with CGS

# Applying arctan color operator to the deconvolved data

The Deconvolved Traces After Applying arctan Color Op.

# Applying Sigmoidal color operator to the deconvolved data

The Deconvolved Traces After Applying Sigmoidal Color Op.

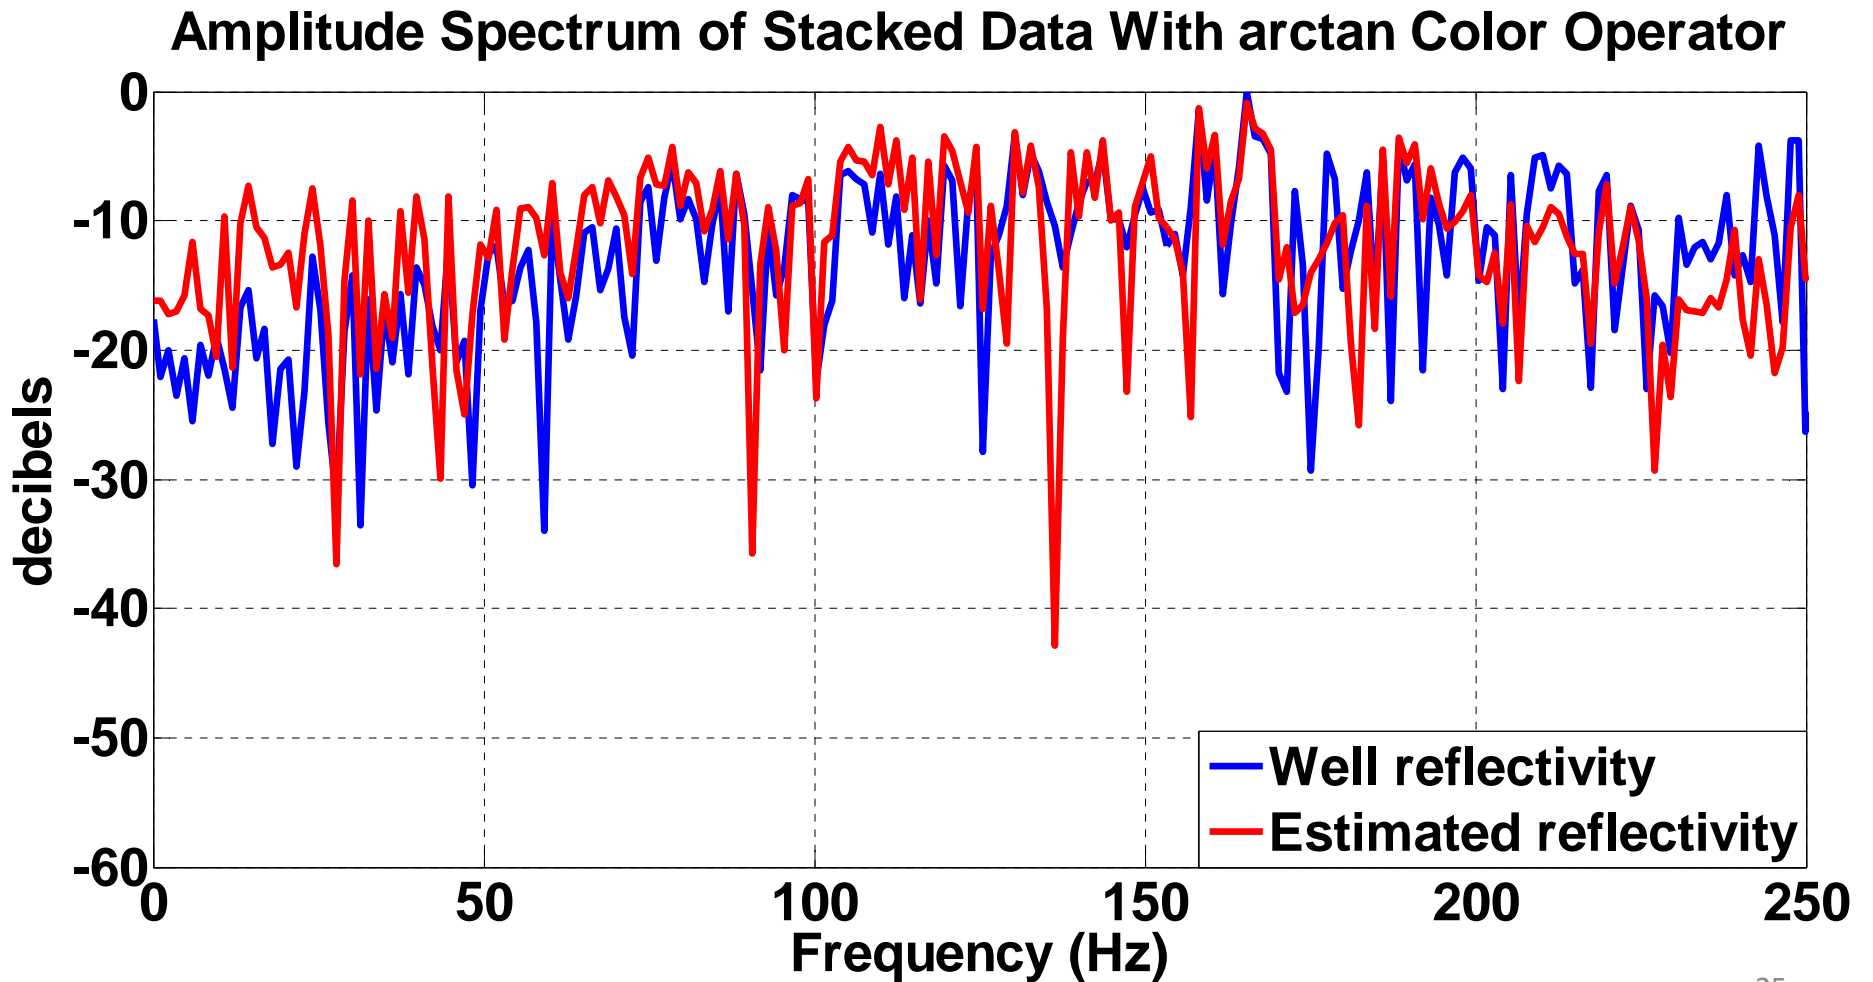

# Applying Forced color operator to the deconvolved data

The Deconvolved Traces After Applying Forced Color Op.

# Amplitude spectrum of stacked data with arctan color operator

# Amplitude spectrum of stacked data with Sigmoidal color operator

# Amplitude spectrum of stacked data with Forced color operator

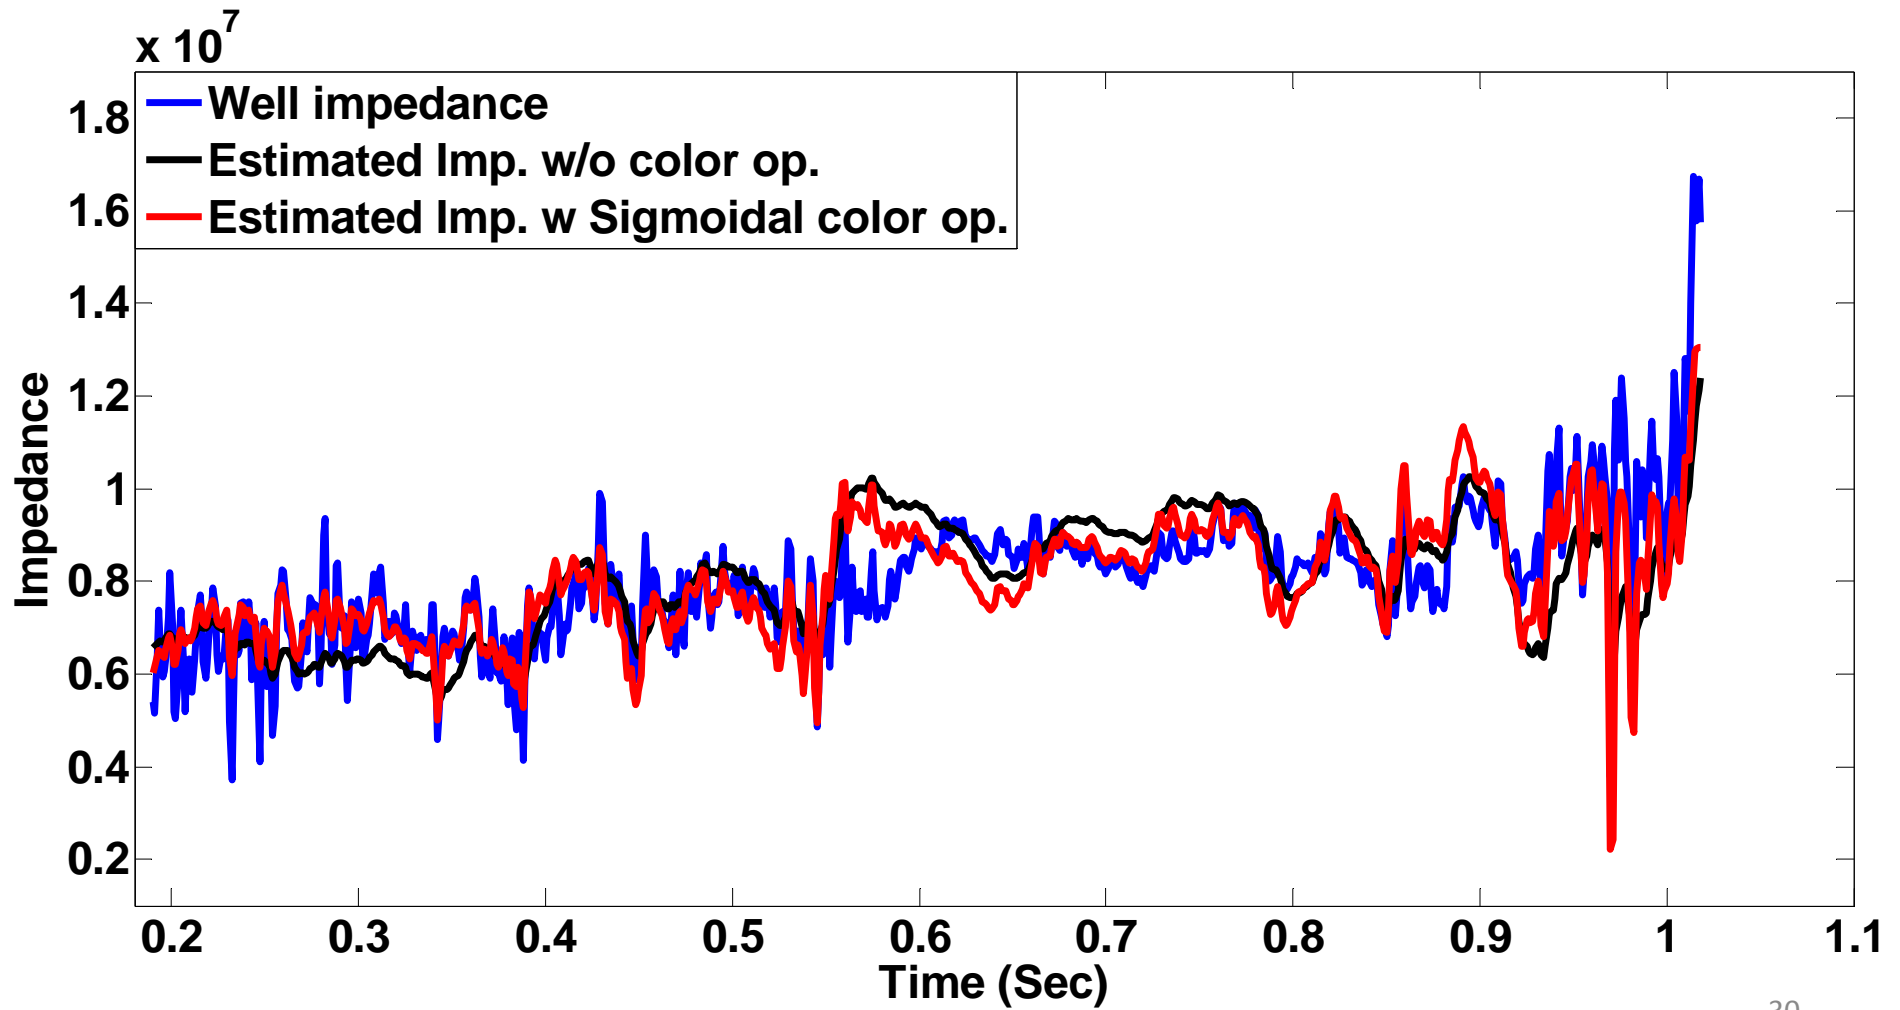

# Impedance inversion

- ✓ The acoustic impedance was calculated by *BLIMP* algorithm in CREWES Matlab toolbox (Ferguson and Margrave, 1996).
- ✓ The low cut-off frequency was selected 1Hz in *BLIMP* algorithm.

# Impedance inversion arctan color operator

# Impedance inversion sigmoidal color operator

# Impedance inversion forced color operator

# Impedance estimation errors in frequency domain

Impedance Inversion Errors In Frequency Domain (Synthetic Shot Gather Data)

# Impedance estimation errors in time domain

Impedance Inversion Errors In Time Domain (Synthetic Shot Gather Data)

# Conclusion

- Deconvolution can be affected by choosing different smoothers but the differences are minor.
- A deconvolved trace shaped to a white spectrum can be corrected by applying a color operator right after deconvolution.
- The result of impedance inversion is greatly improved after applying color correction because this affects the low frequencies.
- Any color correction is better than no color correction.
